The basics You can perform most of the basic editing tasks with a simple, intuitive user interface. Let's look at some basic image editing tasks. Original image Let's begin with an original image.

Getting started Begin by opening the image you want to manipulate. There are three ways to open an image in Photoshop: drag the icon to the Photoshop window; click on the icon on the Photoshop window to open it; or double-click on the image's icon on the Photoshop window. We will use the last method in the tutorial. When the image opens Photoshop will automatically place the image in an artboard. If you want to start a new artboard, click File -> New to create a new artboard. Image tools The icons with a plus sign (+) in the following image are tools that you will use in the tutorial. The Mac icon is also used as a shortcut to change the size of the image you are editing. In the upper-left corner of the image is a small icon with an arrow pointing down, toggles the image down to a smaller size, or up to a larger size. Click and drag that icon to the top or bottom of the image and drag the slider to change the height or width, respectively, of the image in pixels. Most of the time you will have a Quick Fix tool

on a toolbar that you can use to perform most basic editing tasks on the image. These tools are explained below. Click the image to view it in full size to see the small tools on the bottom of the image, as shown in the following image. You also have many options for hiding all of the tools and showing only those you need to perform a particular editing task. You can customize Photoshop's Tool Options (View menu) to hide all of the tools in the screen. Alternatively, you can always click the eye to hide those tools. Editing tools The following tools are activated when you click the tool in the Tools Toolbox window. When you click the tool a small box appears around the image. In the following image, the tools are activated and selected. The following are the tools that you will use to manipulate your image. Tutorial To see how to perform different tasks in Photoshop's native interface, start by clicking the image. Working with layers Layer Photoshop's layers allow you

Getting the Most Out of your Photoshop If you are a bit of a Photoshop pro, or you've just found your way to Elements, you might be interested in adding new tricks to your arsenal. Here are 10 things you can do to get the best out of Photoshop Elements:

Add Filters and Adjust Color You can use one of Photoshop Elements' built-in lenses and filters to change images and improve the quality of your photos. With the Lens Correction tool, you can manipulate the transparency of the lens to prevent the odd checkboard pattern that can appear on some color films. You can also combine lenses to make new ones. The filters, which are also built into Elements, are easy to use. You can choose from various categories like Bevel & Emboss, Blur, Brightness/Contrast, Colorize, Grain, Healing, Interpolate, and Smoothing. You can also use the Levels tool to adjust the image's overall tone. The Hue/Saturation tool can also make a color cast less noticeable. If you want to remove unwanted colors or contrast, use the Blur tool.

You can even use the Eraser tool to remove unwanted elements from the image. **Combine Filters** You can use some of Photoshop Elements' built-in filters to combine different filters into new ones. You can use the Miniature or Cross Process brush to combine effects or get results similar to those used by Photoshop's

blend modes. The Miniature tool is best used for masking. You can use it to help you recreate or remove highlights from a picture. The Cross Process brush is a great way to get rid of unwanted areas in an image, such as a sky or an object. It is also a great way to create a special effect. You can also use the Add Image or Apply Filter tools. The Add Image tool lets you add an image to another one. The Apply Filter tool lets you apply one of Photoshop's filters to any area of an image.

Add Layer Effects

One of the coolest things you can do with Photoshop Elements is add layer effects. Photoshop Elements lets you add layer effects to give images that three-dimensional look. You can make water look like waves or even make your lens a lens. The Watershed tool lets you use shades of colors from the image to make a layer.

You can also turn an image into 8ce3bd8656

Recovery of the facial nerve after endoscopic decompression and myofascial flap transfer in a patient with AICA loop. The authors report the case of a 69-year-old woman who suffered a peripheral facial palsy secondary to a cerebellopontine angle (CPA) lipomyelomeningocele (LMM) of the right cerebellar hemisphere.

The literature on the use of decompressive surgery in the management of CPA-LMM is controversial, but this particular patient was safely managed by a combined endoscopic technique and myofascial flap transfer.

Q: How to write a javascript function to access a variable that is scoped to the window object in a button inside an iframe? I am using IFRAME SRC= method to embed another page within my page. I am trying to add a button on my page which on clicking will write the contents of the "IFrame" into a HTML file. The issue is that the code is not able to access the contents of the variable created using the "this" keyword. I tried accessing the variable like window.content but it gave an error saying that content is undefined. Can someone please help me with a solution. Below is the code that I tried.

```
var content = window.content; var filename = "/Content"; if (content) { var obj = document.createElement("IFRAME");
```

```
document.body.appendChild(obj); obj.src = filename; } A: As the original answer says, you can not just make a reference to the global object, and write code that relies on it directly without first doing a global.someName = "something" to set the value. If it's a single variable, you can simple set it to the global object. This is called a "hack".
```

```
var content = window;
```

You may also access a variable with the window object by using a name that is defined in the global object. This is generally considered bad practice.

```
window.someVar = "some value";
```

If you are using a framework like Backbone, where you have a collection of models, and each model has a "content" property that you want to be part of the global object, then you need to set it to the global object instead.
