When you perform an action that creates files or changes the file system structure on your hard drive, the operating system records that information in a database. Over time, your database will be filled with a large amount of information, consisting of data previously stored in files on your drive. In addition, the operating system maintains a list of information of files that have been used or modified. This list is accessible to applications. Windows Vista removes unwanted files in order to increase performance or create space, which may cause files to become inaccessible to normal users, or even move or delete them. This can lead to system crashes or file loss. These types of operations are significant for your hard drive and cause unnecessary wear on it. Advanced users and those who maintain large hard drives may benefit from a tool that cleans system files and structures to improve performance. Windows 7 and Windows 8 also maintain this database, but it may take up a larger amount of space than in Vista, depending on your installed programs and system settings. WinUtilities Disk Cleaner is a tool that helps you remove unnecessary files and structures. Your computer may experience fewer crashes and your hard drive may be able to cope with larger amounts of data. This may result in an increase in performance.
